

Import Data using Transform Maps (Spreadsheet)

ServiceNow Micro Project Documentation

Phase 5: Project Development Phase

Item	Details
Project Title	Import Data using Transform Maps (Spreadsheet)
Programme	SkillWallet – Vetri Thiran Payirchi
Platform	ServiceNow
Team ID	SWTID-2026-2373

This phase documents how the Employee Data Import solution was built in ServiceNow. Each module below lists what was configured, the exact settings used and the result observed.

5.1 Development Overview

Module	Development Activity	ServiceNow Component	Deliverable
1	Prepare source spreadsheet	Google Sheets / Excel	Sample Spreadsheet.xlsx (15 records)
2	Create custom target table	System Definition > Tables	Employee Test [u_employee_test]
3	Load data into staging table	System Import Sets > Load Data	Employee Import [u_employee_import]
4	Create and configure Transform Map	Table Transform Map	Sample Spreadsheet Import
5	Run transform and validate	Transform / Employee Tests list	15 records in target table
6	Enable Coalesce	Transform Map Field Maps	Coalesce on Employee ID
7	Import updated data	Load Data (existing table)	2 inserts and 2 updates
8	Create reports	Reports (Usage and governance)	3 reports
9	Build dashboard	Dashboards / PA_DASHBOARDS.FORM	Employee Analytics Dashboard

5.2 Development Environment

- Platform: ServiceNow instance, Application scope: Global.
- Role: Administrator.
- Data preparation: Google Sheets, exported as Microsoft Excel (.xlsx).
- Navigation used: Application Navigator (All menu) search.

5.3 Module-wise Development

Module 1: Prepare the Source Spreadsheet

- Create a new Google Spreadsheet named Sample Spreadsheet.
- Add the columns Employee ID, Name, Email, Department and Location with 15 sample records (SB-0001 to SB-0015).
- Download it using File > Download > Microsoft Excel (.xlsx).

Module 2: Create the Custom Table

- Navigate to Tables > Create New.
- Set Label = Employee Test and Name = u_employee_test, then save.
- Add the fields through Show Form > Form Context Menu > Configure > Form Layout > New.

Column Label	Type	Purpose
Employee ID	String	Unique employee identifier
Employee Name	String	Full name
Email	String	Email address
Department	String	Department name
Location	String	Work location

- Save and verify that all five fields appear on the Employee Test form.

Module 3: Create the Import Set Table

- Open System Import Sets > Load Data.
- Select Create table, Label = Employee Import (Name u_employee_import is auto-populated).
- Source of the import = File, choose Sample Spreadsheet.xlsx, Sheet number = 1, Header row = 1, then click Submit.
- Result: State Complete, Completion code Success, message shows Processed 15, inserts 15, errors 0.
- Click Create Transform Map from the Next steps list.

Module 4: Create the Transform Map

Setting	Value
Name	Sample Spreadsheet Import
Source table	Employee Import [u_employee_import] (auto-populated)
Target table	Employee Test [u_employee_test]
Active	true
Run business rules	true
Enforce mandatory fields	No

Setting	Value
Copy empty fields	Unchecked
Order	100

Fields were mapped with Auto Map Matching Fields and Mapping Assist, producing five field maps:

Source Field	Target Field	Coalesce
u_name	u_employee_name	false
u_employee_id	u_employee_id	false (set to true in Module 6)
u_department	u_department	false
u_location	u_location	false
u_email	u_email	false

Module 5: Run the Transform and Validate

- From the transform map, open Related Links > Transform, select the import set (for example ISET0010001) and click Transform.
- Result: State Complete, Completion code Success, message Transformation complete.
- Open Employee Tests from the Application Navigator. All 15 records were created.
- Use Personalize List Columns to order the columns as Employee ID, Employee Name, Email, Department, Location.

Module 6: Enable Coalesce

- Open System LDAP > Transform Maps and open Sample Spreadsheet Import.
- In the Field Maps related list, set Coalesce = true for u_employee_id and save.
- Effect: matching Employee IDs are updated, and only new IDs are inserted.

Module 7: Import Updated Data

- Open Load Data, select Existing table = Employee Import, choose the updated file (Sheet 1, Header row 1) and submit.
- The file contained 4 rows: Raviteja's email changed from test10@gmail.com to test18@gmail.com, SB-0004 renamed from Ajay Kumar to Ajay, and two new employees (SB-0016 and SB-0017).
- Open Run Transform, select the new import set and the same transform map, then click Transform.
- Check Transform History for the counts, then open Employee Tests to confirm the changes.

Module 8: Create Reports

Report	Table	Type	Group By / Columns	Aggregation
Employees by Department	Employee Test	Pie	Department	Count
Employees by Location	Employee Test	Bar	Location	Count

Report	Table	Type	Group By / Columns	Aggregation
Employee List Report	Employee Test	List	Employee ID, Name, Email, Department, Location	None

Path: All > Reports > Usage and governance > Reports > New. Each report was executed with Run and stored with Save.

Module 9: Create the Dashboard

- Open the ACL pa_dashboards (create operation) and set Admin overrides = true, then Update.
- Open PA_DASHBOARDS.FORM and create a dashboard named Employee Analytics Dashboard.
- For each report: open the report, click Share > Add to Dashboard, select Employee Analytics Dashboard and click Add.
- Widgets can also be added with the + icon, and the background colour can be changed.
- Sharing can be limited by users, groups and roles from the Share option.

5.4 Development Results

Run	Input	Total	Inserts	Updates	Ignored	Errors
1. Initial load	15 new records	15	15	0	0	0
2. Changed data load	2 changed and 2 new rows	4	2	2	0	0
3. Same data again	Identical 4 rows	4	0	0	4	0

Report Output	Result
Total records in Employee Test	17
Employees by Department	ServiceNow 11 (64.71%), Salesforce 4 (23.53%), AIML 2 (11.76%)
Employees by Location	Hyderabad 16, Chennai 1
Employee List Report	All 17 records, sorted by Employee ID

5.5 Observations

- Coalesce on Employee ID prevented duplicates. Existing IDs were updated and only SB-0016 and SB-0017 were inserted.
- Re-uploading identical data made no change, so repeated imports are safe.
- The dashboard form opened through the backend name only after Admin overrides was enabled on the pa_dashboards create ACL.
- Screenshots for each module can be inserted under the matching heading in the final report.

Please provide the next sub-topic or phase to continue.
